### BACKGROUND OF THE INVENTION

The present invention relates generally to 12 hardware/software systems for generating audio and/or video 13 sequences of prescribed duration and more particularly to such 14 systems suitable for generating and correlating such sequences 15||for producing multimedia presentations.

Exemplary multimedia presentations are formed from 17 video source material, e.g., a video segment such as a film clip, 18 and audio source material, e.g., an audio segment such as a sound Typically, the video source segment must be edited many 19 track. times before an aesthetically satisfactory and proper duration video output sequence is achieved. The audio source segment must 22 similarly be edited to form an audio output sequence that matches 23 the duration of the edited video output sequence.

## SUMMARY OF THE INVENTION

The present invention is directed toward a system for compiling a sequence of data blocks for producing an audio and/or video output sequence having a duration corresponding to userprescribed criteria.

In a preferred embodiment, a user (via a keyboard and/or mouse and a display monitor) chooses an audio and/or video segment from a data storage library storing data representing original sound tracks, MIDI data, film clips, 10 $\parallel$ animation clips, etc., and prescribes the desired duration of an 11 audio and/or video output sequence. Each segment in the data 12||storage library is divided into data blocks whose characteristics 13 are identified in a stored characteristic data table. Exemplary 14 characteristics include (1) duration, (2) suitability for being 15 used as a beginning or ending of an output sequence, and (3) 16 interblock compatibility. Using this stored characteristic table 17 and user-prescribed criteria (e.g., a duration specified via the 18 keyboard), a block sequence compiler (preferably a software 19 program executed by a computer) generates a plurality of audio and/or video block sequences satisfying these criteria which can 21||be reviewed (e.g., played via an audio and/or video output device 22 or displayed on a monitor) and/or saved for future use.

In an exemplary use, the block sequence compiler 24 compiles a first output sequence suitable for presentation on a 25 $\parallel$ first channel. Optionally, the block sequence compiler can also 26 compile one or more additional output sequences compatible with  $27\|$ the first output sequence (according to additional stored

28

5

6

12

15

21

1 characteristic table parameters) suitable for presentation on 2 additional output channels to create a multimedia presentation.

In a further aspect of a preferred embodiment, the 4|block sequence compiler is responsive a user-prescribed mood parameter stored in the characteristic table.

In a still further aspect of a preferred embodiment, the stored characteristic table additionally contains a parameter 8 that identifies blocks that are fadeable. When a fadeable block  $\parallel$ is selected as an end block, the block sequence compiler can 10 truncate the fadeable end block to generate an output sequence of 11 the prescribed length which might otherwise not be achievable.

In a further aspect of a preferred embodiment, the 13||block sequence compiler is responsive to a user-prescribed 14 intensity parameter stored in the stored characteristic table.

In a still further aspect of a preferred embodiment, 16 each block is identified in the stored characteristic table as 17 having a hit point that defines the location (when present) of an 18 intensity burst. The block sequence compiler can use the hit point parameter to place an intensity burst at a user-prescribed location in the compiled output sequence.

In another aspect of a preferred embodiment, 22||system enables a user to generate a sequence (or subsequence) of 23 data blocks which can be executed one or more times, e.g., 24 looping, to form an output sequence of extended duration. 25||first variation, the compiler selects the last block of a 26 sequence which is compatible with the first block to generate a repeatable sequence. Accordingly, the repeatable sequence can be 28 $\parallel$ repetitively executed from the first to the last block and then 1 looped back to the first block. In a second variation, blocks in 2 the repeatable sequence are selected which have a reversible 3 attribute, i.e., blocks that can be played either in a forward or 4 a reverse direction. Accordingly, the repeatable sequence can be 5 repetitively played in a forward direction from the first to the 6 last block and then in a reverse direction from the last block to 7 the first block, again resulting in a sequence having an extended duration.

Other features and advantages of the present invention 10 should become apparent from the following description of the 11 presently-preferred embodiments, taken in conjunction with the 12 accompanying drawings, which illustrate, by way of example, the 13 principles of the present invention.

### BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 comprises a functional block diagram of a block sequence compiler in accordance with the present invention for generating audio and/or video sequences having user-prescribed durations;

FIG. 2 is a simplified diagram of a characteristic table showing the parameters associated with each audio and/or 8 video block;

FIG. 3A is a simplified flow chart of the operation of 10 the system of FIG. 1;

FIG. 3B is a simplified flow chart depicting the 12 process implemented by the block sequence compiler;

FIG. 4 is an exemplary characteristic table for a 14 fifty second source audio and/or video segment;

FIG. 5 shows the iterations performed by the block 16 sequence compiler according to the flow chart of FIG. 3B on the 17 characteristic table data of FIG. 4;

FIG. 6 is a simplified flow chart depicting the 19 process implemented by the block sequence compiler to compile a 20 repeatable audio and/or video sequence generated by looping the 21 | last block to the first block of the compiled sequence;

FIG. 7 shows the iterations performed by the block 23 sequence compiler according to the flow chart of FIG. 6 on the 24 characteristic table data of FIG. 8;

FIG. 8 is an exemplary characteristic table for a second source audio and/or video segment used in 27 conjunction with the flow chart of FIG. 6;

FIG. 9 is a simplified flow chart depicting the 2 process implemented by the block sequence compiler by selecting 3 blocks having a reversible attribute to compile a repeatable 4|audio and/or video sequence;

FIG. 10 is an exemplary characteristic table for a audio 6||fifty second source and/or video segment 7 conjunction with the flow chart of FIG. 9;

FIG. 11 is block diagram an exemplary system for 9 generating multiple compatible audio and/or video channels, i.e., 10 multimedia, according to user-prescribed criteria; and

FIG. 12 is a simplified diagram showing multiple audio 12 and/or video channels generated by the exemplary system of 13 FIG. 11.

### DESCRIPTION OF THE PREFERRED EMBODIMENTS

With reference now to the drawings, and particularly 1, there is shown a block diagram of a preferred to FIG. embodiment of an audio and/or video sequence generator 10 of the present invention for compiling a sequence of data blocks suitable for producing an audio and/or video output sequence 7 having a duration corresponding to user-prescribed criteria. 8 a preferred embodiment, the sequence generator 10 is comprised of 9 a computer-executed software program, generally initially present 10 on a floppy disk, and which preferably finally resides on the 11 hard disk of a personal computer (PC) 12, e.g., a Macintosh or 12 BM compatible PC, controlled by a processor 13. As such the 13 following discussion, relates to these preferred PC environments. 14 However, different computer platforms hardware-only or15 implementations are also considered within the scope of the 16 invention.

The sequence generator 10 is primarily comprised of (1) a data storage library 14 (preferably comprised of data blocks corresponding to or pointing to audio tracks, MIDI data, video clips, animation, or any other data representative of sound or visual information) and (2) a block sequence compiler 16. operation, a user interface 17, e.g., a keyboard/mouse 18, enables a user to select a source segment 28 from the data storage library 14 and prescribe a duration. This information is 25 communicated to the block sequence compiler 16 which, under 26 control of a software program executed by the processor 13 in the 27 PC 12, fetches blocks of audio and/or video source information (preferably digital data) from the data storage library 14 and,

1 according to compilation criteria described further below, 2 compiles a list of potential audio and/or video sequences that 3 are preferably temporarily stored within a potential block  $4\parallel$  sequence list depository 19. In the case of audio (e.g., an 5 audio track or MIDI data) output sequence, the user can select to 6 play the audio sequence via a sound card/speaker 20, review a 7 list of potential block sequences via a monitor 21, or store 8 selected sequences for future use, e.g., on a hard disk 22. 9|Alternatively, in the case of a video sequence (e.g., video clip 10 or animation data), the user can select to play the video 11 sequence (preferably via a video card 24 and monitor 21), review 12 a list of potential block sequences via the monitor 21, or store 13 selected sequences for future use, e.g., on the hard disk 22. 14 $\parallel$ either case, the block sequence compiler 16 can preferably be 15∥directed to only compile a single audio and/or video output 16 sequence and then wait until prompted by the user to generate a 17 next audio and/or video output sequence.

data storage library 14 preferably contains 19||library entries 26 pertaining to a plurality of audio and/or 20 video source segments. Each library entry 26 is comprised of (1) an audio and/or video source segment 28 and (2) a stored 22 characteristic data table 30 which describes the partitioning of 23||the audio and/or video source segment 28 into multiple data 24 blocks and the characteristics of each block. Although, the 25 source segment 28 is shown as being located within the data 26||storage library 14, one of ordinary skill in the art will 27 recognize that the source segment 28 can alternatively be 28 physically located outside of the library, e.g., on a CD-ROM or

1 DVD, and referenced, e.g., by pointers, by the characteristic 2 table 30. FIG. 2 shows an exemplary structure for the 3 characteristic table 30. Each entry 26 in the characteristic 30 contains a definition/pointer 32 which  $\parallel$ identifying information for the library entry, e.g., a title and 6 the physical location of the audio and/or video source segment  $7\|28$ , e.g., a CD-ROM file. Each characteristic table entry 30 is 8 further divided into a plurality of entries that define blocks, and/or video audio data blocks, and associated 10 characteristics for the audio and/or video from the audio and/or 11 video source segment 28.

In a simplified example, an audio and/or video source 13 segment 28 is divided into five blocks: A, B, C, D, E, F where 14||the sequence ABCDEF corresponds to the audio and/or video source 15 segment 28. Although, other combinations of blocks, e.g., 16 FEDCBA, can also create audio and/or video sequences, not all 17||block sequences will create aesthetically reasonable audio and/or Thus, information is preferably derived to 18 video sequences. 19 determine interblock compatibility, i.e., the ability of a block 20 to sequentially follow (or alternatively sequentially precede) 21 each other block according to aesthetic, e.g., musical, criteria. 22|For example, while block C may reasonably follow block B, it may 23 not be aesthetically reasonable for it to follow block A. 24 Additionally, while some blocks, e.g., A, are suitable according 25||to aesthetic criteria to reasonably start an audio and/or video 26 sequence, other blocks are not. Similarly, only certain blocks, F, suitable according to aesthetic criteria to are 28 reasonably end an audio and/or video sequence. Lastly, not all

1 audio and/or video source segments 28 can reasonably be divided 2 into fixed length blocks. In fact, using reasonable aesthetic blocks will generally be differently sized. 3 criteria. Consequently, audio and/or video sequences of many different durations can be achieved by combining different combinations of 6 these differently-sized blocks. However, as previously 7 described, the available combinations are limited by the 8 compatibility between potentially adjacent blocks as well as their suitability to begin or end an audio and/or video sequence. 10 Corresponding to these criteria, data in the characteristic table contains parameters for each audio and/or video block  $12\parallel pertaining$  to a (1) duration 34, (2) type attribute (e.g., 13|beginning/ending) 36, and (3) an interblock compatibility list 38 (e.q., a list of which blocks can aesthetically follow and/or 15 precede the current block). Additionally, information (not 16|shown) identifying the physical location of each audio and/or 17 video block in the audio and/or video source segment 28 is 18 preferably retained in the characteristic table 30. While data in the characteristic table 30 can be manually generated, automated procedures are also possible.

FIG. 3B shows a simplified flow chart exemplary of the 22 iterative process implemented by the block sequence compiler 16 23 after being provided the user-prescribed data (as shown in 24 FIG. 3A). As previously described, after the user has determined 25∥a selection 40 from the data storage library 14 and a duration 26|42, the block sequence compiler 16 operates on the data in the 27 characteristic table 30 according to the flow chart of FIG. 3B. 28 Accordingly, a list of potential output sequences is compiled

26

1 that conform to the characteristic table 30 and these sequences 2 are stored in the potential block sequence list 19. In order to conform to the characteristic table, each block in an output sequence must be compatible with each adjacent block according to its interblock compatibility characteristic 38, i.e., each block must be compatible with blocks which directly precede and follow ||in an output sequence. Additionally, it is preferable that each 8||sequence begin with a block having a beginning characteristic 38 9 set and end with a block having an ending characteristic 36 set.

FIG. 4 shows an exemplary characteristic table for a 11 fifty second audio and/or video source segment 28. 12 example, the source segment is partitioned into ten blocks, each 13 being five seconds long. (While fixed length blocks exist in 14 this example, this is generally not the case). In this example, 15 blocks A and C have been marked as potential beginnings and 16 blocks E and J have been marked as potential endings. 17 example shown in FIG. 5, the user has selected a duration 42 of thirty-five seconds for this source segment 28. Accordingly, FIG. 5 shows the iterations performed by the block sequence compiler 16 on the characteristic table 30 of FIG. 4 according to the flow chart of FIG. 3B. FIG. 5 shows that the original audio and/or video sequence has now been rearranged into three 23 potential sequences (ABCDEFGJ, ABCDEFHE, CDEFGHIJ) that each (1) 24 have the prescribed duration, (2) begin with a beginning block, and (3) end with an ending block.

In an exemplary audio environment, the generator 10 allows users to quickly and easily create movie or record quality 28 music soundtracks for any application or document that can import

sound. The sequence generator 10 is able to accomplish this by processing an audio source segment, e.g., music, in response to user inputs. The user selects a musical style and sub-style from a list, then specifies the length (preferably in minutes, seconds and tenths of seconds). A musical source segment is selected from the library that meets the user's needs and a custom version of that music is created that is exactly (within user-prescribed criteria) the specified length. If the user doesn't like the selected music, the user can hear a different version of the same music or a different piece music - all of the versions presented will fit the user's specifications.

By using music and its corresponding characteristic table 30 and input from the user, the block sequence compiler 16 can customize the following aspects of the music:

- The length of the music can be customized in tenths of a second increments from seconds to hours.
- Different versions of the same piece of music (sometimes hundreds of thousands of options) can be generated.
- In an alternative embodiment, the block sequence compiler 16 can customize the intensity of the music. The user can define a desired intensity curve 44. This will allow the user to have the program make a piece of music that begins softly (perhaps while an announcer speaks) and builds to a climax (perhaps when the narration has ended). In this embodiment, an intensity parameter 46 is added to the characteristic table 30 for each block and the block sequence

compiler 16 selects blocks that most closely correspond to the prescribed intensity curve 44.

In a next alternative embodiment, the user can specify a mood selection 48 to modify the mood of the music without changing any other characteristics. embodiment, parameter 50 is added mood characteristic table 30. Additionally, renditions of the audio source segment prerecorded corresponding to different moods. The block sequence compiler 16 will then select renditions that correspond to the prescribed mood parameter 50. In another alternative embodiment, a user can specify a first duration of background music followed by a second duration of introductory music. The compiler 16 will be able to locate two different pieces of music and make a smooth, musical, transition between them.

In an additional alternative embodiment, blocks can be identified with a fadeable parameter 52 in the characteristic table 30. When a block is fadeable, its duration can be truncated to become a satisfactory end block, even if its duration would normally be too long. The compiler 16 can then truncate the fadeable block to achieve the user-prescribed duration. Additionally, the intensity of the end of the fadeable block will fade at a prescribed rate to reduce the effects of the truncation.

//

20

21

22

25

26

another embodiment, each block can be identified in the characteristic table 30 as having a hit point parameter 54 that defines the location (when present) of an intensity burst. When prescribed by the user, the block sequence compiler 16 can use the hit point parameter 54 to place an intensity burst at a user-prescribed location (e.g., defined by intensity curve 44) in the generated audio output sequence.

Similar aspects of a corresponding video (e.g., video clip or animation) sequence can also be customized by the compiler 16 according to data within the characteristic table 30. 13 For example, if a static parameter 55 is placed within the 14 characteristic table 30, this parameter can be used to identify 15 blocks, preferably additionally having an ending type 36, that 16∥can be extended to a desired duration and thus can be used to 17 simplify matching the user-prescribed duration 42. Accordingly, 18 especially in a video environment, the last block can end with a 19||still picture (a "freeze frame") that can be maintained as long as required to produce a sequence having the prescribed duration 42.

The following defines the data structure for each the characteristic table in this exemplary audio embodiment:

fileInfo a pointer to which audio source segment this

block is associated with

blockStart the sample number within the audio source segment at which this block begins

1	blockLength	the number of samples that this block contains.					
2		The end sample number is derived by adding blockStart and blockLength					
3	blockName	the name to display on this block (no longer than 15 characters					
4							
5	blockDesc	the long text description of this block (up to 63 characters)					
6	compatibility	an array of bits specifying this block's					
7	,	compatibility with all other blocks in this file (described below)					
8	usageFlags	bit flags indicating properties of this block					
9	usageriags	(described below)					
10	nextBlock	the block number of the best block to following					
11		this block					
12	quickEnd	the block number of the best next block to end the music quickly					
13	blockSection	a section number of this block assigned for use					
14		in grouping sub-blocks into grouped blocks for display					
15	blockPriority	a priority number of this block assigned for use					
16	DIOGRIFICITES	in displaying blocks at different detail levels					
17	blockType	a set of bits specifying if this block should be					
18		displayed, if the block is in-use, and other status flags. USER BLOCK TYPE,					
19		INVISIBLE_BLOCK_TYPE, AVAILABLE_BLOCK_TYPE					
19	selected	a True/False flag indicating if the block is					
20		currently selected					
21	intensity	each block is assigned an intensity index in					
22		relation to the other blocks in the file. The higher the intensity number, the more intense					
23		the audio in the block is in relation to the other blocks.					
24	   hitPoint	the sample number, if any, of a musical "Hit"					
25		within the block. (0 for no significant hit)					
26	moodIndex	a number grouping this blocks mood with other blocks mood. All blocks with the same moodIndex					
27		will have the same mood.

a pointer to the next block

Compatibility

Each block has an array of unsigned longs which are used as an array of bits. Each bit corresponds to a block from the data storage library 14, e.g., bit 15 should be set if the block is compatible with block 15. Compatible blocks are blocks which sound musically correct when they are played one after the other. For example, Block A should be flagged as compatible with Block B when it sounds musically correct to listen to Block A If Block B was the 24th block from the followed by Block B. library source segment, then bit 24 of Block A's compatibility array should be set.

### USAGEFLAGS

DEAD END FLAG

Set if this block will lead you directly Set this bit if this toward an ending. block is a bad choice to build a long cue

(1L<<0)

NEXT CONTIGUOUS FLAG

Set this bit if the next block doesn't need a crossfade to make a good sounding transition

(1L << 1)

FADEABLE BLOCK

Set this bit to signal that this block can be effectively faded (in volume) to any length.

(1L << 2)

BEGINING BLOCK

Set this bit if the block is a good choice (sounds musically correct) to begin a selection

(1L<<30) // 0x40000000

25 ENDING BLOCK

Set this bit if the block is a good

choice to end a selection (1L<<31) // 0x80000000

```

### HINTING/WARNING

Using the characteristic table data associated with each data block, the user is assisted by visually displaying information about the blocks. Block attributes beginnings, endings and compatibility are all displayed.

Beginning-	displayed by a stair-step pattern on the left edge of the block
Ending-	displayed by a stair-step pattern on the right edge of the block
Compatibility-	the rightmost end cap of a selection in the sequence window is colored and all of the compatible blocks in the block window will have their left end caps colored.
Warning-	when two non-compatible blocks are next to each other, we display a red edge at their junction.

22

The process of specifying characteristics of music and sound is both musical and technical. This process is used to 3 provide as much information as possible about each piece of music  $4 \parallel$  or sound so that the compiler 16 can make informed, musical 5 decisions, when it manipulates the music according to requests from users. This process includes the following:

- Block Start and End: The beginning and ending of each discrete music section (block) is determined. This necessarily determines the length of each block. Listen to the piece of music and divide it into segments based on musical phrases and musical uses called blocks. On average, there are fifteen blocks per minute of music.
- Block Name: Code each block with a name and 2. description.
- Beginning Blocks: For each block a determination is made as to whether it would make a good way to start a musical section or phrase.
- 4. Ending Blocks: Same concept as that described for Beginning Blocks.
- 5. Block Compatibility: Each block is tested for its specific compatibility to each and every other block which comprise the source audio segment.
- Intensity: Code each block's musical intensity relative to other blocks.
- Fadeable Block: Each block has a determination made as to whether it sounds musically viable to fade or not.

In a further aspect of the present invention, a user 23 may alternatively prescribe a repeatable audio and/or video 24 sequence (or subsequence), e.g., a looping sequence, that is 25 | capable of repeating and thus has an extended duration. 26 embodiment, a last block 56 of a compiled sequence 58 is chosen 27||that is compatible (according to compatibility data 38) with a 60 of the compiled sequence 58.

1 beginning/ending attribute 36 is of limited significance with 2 such a repeatable sequence (and accordingly an ending attribute 3 is preferably not required), it is still aesthetically preferable that the sequence initially begin with a block having a beginning attribute. Additionally, while a principal duration 62 of the compiled block sequence (the time duration from the beginning of 7| the first block of the repeatable sequence to the end of the last 8||block of the repeatable sequence) does not alter the duration of 9 the looping sequence (i.e., repeating a twenty second portion 10||thirty-five times or repeating a thirty-five second portion 11 twenty times both result in the same extended durations), the 12 aesthetic effect of such sequences are generally effected by the 13 principal duration 62. Accordingly, it is preferable that the 14 block sequence compiler 16 accept directions via user interface 15 17 to determine the sequence of blocks according to duration 42.

Accordingly, using the exemplary flow chart of FIG. 6, 17 $\|$ a user specifies duration 42 to specify the principal duration 62. FIG. 7 shows the processing of the data of FIG. 8 according 19 to the flow chart of FIG. 6 for a principal duration of thirty-20 five seconds (compiling sequences ABCDEFGJ and 21||Accordingly, it is noted that while the end block of the 22 principal loop may have an ending attribute 36 (e.g., block E), not a requirement of the algorithm of FIG. 24 Additionally, FIG. 7 shows the alternative processing when the 25 algorithm of FIG. 6 is altered to eliminate the restriction 26 (specified in program step 64) that requires that the compiled 27 sequence begin with a block having a beginning attribute 36. 28 Consequently, a sequence of CDEFGHIJ is compiled.

19

25

26

1

In a next variation, e.g., in a visual environment, 2 portions of the source audio and/or video segment 28 determined which can play equally well in a forward or in a 4 reverse direction. Accordingly, an infinite loop can be defined by selecting a sequence of compatible blocks accordingly to compatibility list 38 that additionally have a reversible 7 attribute 66 set. Accordingly, if block sequence compiler 16  $8\parallel$ operates on the data of FIG. 10 according to the algorithm of 9||FIG. 9 and a prescribed duration 42 of twenty seconds, a sequence 10 of CDEF, CDCD, or CDED will result. When played, these sequences 11 will preferably reverse in direction at the end of the last block and at the beginning of the first block (when being played 13 backwards).

While the above description has primarily discussed 15 uses where the entire sequence is repeatable, alternative uses 16 are also considered within the scope of the present invention. For example, the repeatable sequence could be only a portion, i.e., a subsequence, of the compiled output sequence. exemplary case, a first portion of the output sequence is compiled according to first user-specified duration (J), a second portion of the output sequence is compiled according to a second 22 user prescribed principal duration (K) that is repeatable a userspecified number of times (L), and a third portion of the output sequence is compiled according to a third user-specified duration Consequently, the resulting duration will be J+(K\*L)+M.

described, embodiments of As the invention are 27 suitable for generating audio and/or video output sequence  $28\parallel$ suitable for presentation on a single output channel, e.g., as a

1 single audio track, a single MIDI output, a single video clip 2 output, a single animation, etc. In an exemplary use, it may be 3 required to compile a thirty second video sequence as a video 4 output to combine with an existing audio track, e.g., assorted 5||pictures of a new car with a predefined description of its features, or to add a musical interlude to a predefined video 7 clip, and thus create a car commercial. However, it may also be 8 desirable to compile both a video sequence and an audio sequence 9 to satisfy the user-defined duration criteria 42, e.g., thirty However, it will generally be significant that the 11 $\parallel$ audio and video channels correlate, e.g., an audio track describing braking characteristics should not be combined with video clips of crash tests. Therefore, FIG. 11 shows a simplified block diagram of an embodiment that enables compiling (using multiple block sequence compilers 16a-16n or preferably by 16 time sharing a single block sequence compiler 16) multiple channels of audio and video 68a-68n, i.e., multimedia, and crosscorrelating the potential block sequence lists 19 using crosscorrelator 70 to ensure compatibility between the multiple channels. To achieve this task, the cross-correlator 70 operates upon additional compatibility data 38, e.g., data which shows the 22 | interblock compatibility between the blocks in each channel 68, 23|i.e., interchannel compatibility. For the example of FIG. 12, 24 the characteristic table 30 contains additional compatibility 25 data 38 to ensure that BLOCK 1, is compatible with both BLOCK 1, 26 and BLOCK 21 (since the blocks sizes are not the same on CHANNEL,  $27\|$ and CHANNEL,, BLOCK  $1_n$  overlaps both BLOCK  $1_1$  and a portion of 28 BLOCK  $2_1$ ).

Although the present invention has been described in detail with reference only presently-preferred to the 3 embodiments, those of ordinary skill in the art will appreciate 4 that various modifications can be made without departing from the 5||invention. Accordingly, the invention is defined by the 6 following claims.

### ABSTRACT OF THE DISCLOSURE

2

3

1

A block sequence compiler for compiling a sequence of audio and/or video blocks (e.g., audio tracks, MIDI, video clips, animation, etc.) suitable for producing one or more audio and/or video output sequences (i.e., audio, video, or multimedia) each 7 having a duration corresponding to user-prescribed criteria. a preferred embodiment, a user chooses an audio and/or video source segment from a predefined library and prescribes the duration of an audio and/or video sequence. Prior to depositing 11 each audio and/or video segment in the library, the segment is 12 partitioned into audio and/or video blocks that are identified in 13 a corresponding characteristic data table with characteristics 14 including (1) duration, (2) suitability for being used as a 15 beginning or ending of an audio and/or video sequence, and (3) 16 compatibility with each block. Using this characteristic table and the user-prescribed criteria, i.e., duration, the block 18 sequence compiler generates a plurality of audio and/or video 19 sequences satisfying the user-prescribed criteria which can be 20 reviewed, e.g., played, and/or saved for future use.

### CLAIMS

We claim:

3

4

1

2

suitable for producing an audio and/or video output sequence having a prescribed duration, said system comprising:

7

and/or video source segments wherein said table contains entries

10

13

15

19 20

21

23

24

26

27

A system for compiling a sequence of blocks 1.

a stored data table referencing one or more audio

to partition each of said segments into multiple data blocks; said table entries defining the characteristics

of each block including its duration, its suitability to begin or end a sequence, and its interblock compatibility;

a user interface for enabling a user to prescribe 14 a sequence duration; and

block sequence compiler for iteratively 16||compiling a list of one or more sequences each comprised of a plurality of blocks selected according to said user-prescribed sequence duration such that each said sequence conforms with said table entries.

- 2. The system of claim 1 additionally comprising 22 means for displaying said list.
  - 3. The system of claim 1 additionally comprising means to store at least one said sequence from said list.
- The system of claim 1 additionally comprising 28 means to play a selected sequence from said list.

7

8

14

15

21

22

The system of claim 1 wherein said table 5. 2 additionally comprises data corresponding to a mood parameter for 3 each said block and said user interface additionally enables a  $4 \| ext{user}$  to prescribe a mood parameter and said block sequence compiler selects blocks according to said user-prescribed mood parameter.

6. The system of claim 1 wherein said table additionally comprises data corresponding to a fadeable parameter 10 for each said block and said block sequence compiler selects an 11 ending block having said fadeable parameter set and wherein such 12∥fadeable blocks can be truncated to achieve audio and/or video

sequences of said user-prescribed sequence duration.

- The system of claim 1 wherein said table 16 additionally comprises data corresponding to an intensity 17||parameter for each said block and said user interface 18 additionally enables a user to prescribe an intensity curve and 19|said block sequence compiler selects blocks according to said 20 user-prescribed intensity curve.
- The system of claim 1 wherein said table corresponding to a hit 23 additionally comprises data 24 parameter for each said block for specifying when an intensity 25∥burst is present within said block and said user interface 26 additionally prescribes an intensity burst location and said 27 block sequence compiler compiles sequences of said blocks 28 according to said user-prescribed intensity burst location.

The system of claim 1 wherein said user interface 9. 2 additionally enables a user to prescribe one of said audio and/or video source segments and said processor compiles sequences of blocks selected from said user-prescribed segment.

5

6

1

10. The system of claim 1 wherein said table additionally comprises data corresponding to a static parameter 8 for each said block and said block sequence compiler can select 9 a ending block having said static parameter set and wherein such 10 static blocks can be extended to form sequences of said user-11 prescribed duration.
